

Big Rock Exploration AB has applied for an exploration permit with high levels of REE metals.

Big Rock Exploration AB is applying for an exploration permit with high levels of the REE metals lanthanum, cerium and neodymium.

The applied for exploration permit "Repabergsgruvorna" is located northwest of Nora in Örebro County. There are a number of old iron mines in the area. In the slag heaps from these mines, SGU has at two places found the REE metals lanthanum (La), cerium (Ce) and neodymium (Nd). The highest levels from these rock samples are 0.91% lanthanum, over 1% cerium and 0.68% neodymium.

As soon as the exploration permit has been granted, Big Rock Exploration AB intends to perform a magnetic surveys and additional rock samples for analysis to investigate the extent of these REE metals.

CEO Alexander Andersson's comment:

"I am pleased that the Company has identified and applied for another interesting REE area. It is with excitement that I look forward to the upcoming surveys and answers from the stone samples "
