

Big Rock Exploration AB is granted two exploration permits for rare earth metals and zinc.

During week 43, the company received two exploration permits from Bergstaten. Within the granted areas, rare earth metals and high values of zinc have been detected.

The exploration permit "Rostberget" is located in Ludvika municipality, Dalarna. In this area, rock samples from warp piles have been carried out and show levels of the following:

Silver 205 ppm, gold 1.26 ppm, copper 0.43%, iron 28.3%, lead 4.06%, zinc 7.04%. (source SGU)

The other granted exploration permit "Östra Gyttorps Gruvorna" is located in Nora municipality, Örebro county. This area is particularly interesting as elevated values of rare earth metals have been demonstrated. SGU (Swedish Geological Survey) has carried out rock samples of slag heaps where "ALS Minerals AB" analyzed and confirmed the following:

1% lanthanum (La), 1% Cerium (Ce), 1% Neodymium (Nd)

CEO Alexander Andersson's comment

"Now that the first process has been completed with these areas, the company will produce a work program for each exploration permit with the aim of starting geophysical surveys by the spring of 2022.
