

## Big Rock Exploration AB has begun geophysical surveys on Rostberget.

**During week 19, Big Rock Exploration AB has begun magnetic and electrical surveys on the exploration permit Rostberget.**

The purpose of the magnetic and electrical surveys is to investigate the extent of anomalies at the old mining holes on Rostberget where commercially recoverable levels of gold, silver, copper, lead and zinc have been found by SGU. In addition to these metals, SGU has also found iron in rock samples from the old mining area.

The levels at Rostberget are 205ppm silver, 1.26ppm gold, 0.43% copper, 28.3% iron, 4.06% lead and 7.06% zinc.

Big Rock Exploration AB intends to present the results from these surveys during Q2-Q3 2022.

### **CEO Alexander Andersson's comment:**

"It will be extra interesting to start work on Rosberget as several different minerals with interesting levels are reported."
